

Ting, Joseph

Dr. Joseph Ting completed his Pediatrics Residency at Queen Mary Hospital, Hong Kong in 2006 and obtained his Postgraduate Diploma in Infectious Diseases & Master of Public Health (Medical Statistics) from the University of Hong Kong in 2007 & 2009, respectively. Between 2010 – 2013 he received his fellowship training in Neonatal-Perinatal Medicine in Vancouver, six months of which was spent at The Hospital for Sick Children in Toronto where he received advanced training in neonatal hemodynamics. Dr. Ting is currently a Clinical Associate Professor in the Division of Neonatology, Department of Pediatrics, at the University of British Columbia. He also receives salary support from the British Columbia Children's Hospital Research Institute through the Investigator Grant Award Program.

Dr. Ting's main research interests fall into two aspects: (i) neonatal infections & antimicrobial stewardship; and (ii) small-for-gestational age infants. He is interested in conducting (i) population studies to better understand the predictive variables associated with these conditions, in addition to their accompanying neonatal outcomes; and (ii) targeted neonatal echocardiography studies to describe their haemodynamic changes to develop supportive strategies for these vulnerable infants.

He serves on the Antimicrobial Stewardship Committee at the British Columbia Women's Hospital (BCWH) and carries out studies on the surveillance of neonatal infections and rational antibiotic utilization at local and national levels. He is also the site investigator for the Canadian Neonatal Network at BCWH. Conducting collaborative research is one of his many passions in hopes of enhancing neonatal-prenatal health.
